

LÜ 10/06

ROLAND BODEN/Institut fuer Subreale Urbanistik: Chaotic Magnetic Vortices

Opening: 30.9., 7 pm. Duration: 1.–29.10.2006

Recently, there have been repeated reports of strange occurrences of heat and light in the area of Schlesischer Busch, the area between what today is called Puschkinstraße and Jordanstraße, and between Flutgraben and Bouchéstraße in Berlin Treptow. It is said that metal objects heat up abnormally, sometimes all the way to glowing, and incidents of lightning-like discharges and a grumbling and booming that seemingly comes from the ground are reported. These occurrences happen only very rarely and irregularly, and usually do not last long.

A correlation with meteorological or atmospheric causes can definitely be ruled out. The cause of these occurrences clearly lies in the centre of the earth. Since these phenomena are especially linked to strong magnetic field fluctuations, we must assume a magnetic anomaly, for which we have the term of chaotic magnetic vortex, a term controversial among experts since 1922. What is assumed here is a geologically not explicable Ferrite vein of magnetite, which is possibly caused by a gigantic deposit of dead magnetotactic bacteria whose body contains a mineral which these organisms use for orientation in the earth's magnetic field. This massing leads, when initialised in the sense of a vertical clumping, to an extremely strong short-term unbalance in the earth's magnetic field. When such a magnetic eruption happens, especially iron objects in the area of influence heat up very strongly, in single cases it can even lead to flash-like evaporations. People with a disposition for such occurrences can even in a greater distance perceive so-called magnetophosphenes.

In this context, several occurrences from the older and more recent past now appear in a different light. Undoubtedly the oldest occurrence is the mysterious demise of a Mongolian group of fighters after the battle of Liegnitz in Silesia in April 1241. A Mongolian division under the leadership of Kaidu Khan had beaten the united German-Polish army of knights and now threatened to overrun all of central Europe. To this purpose, the Mongolians sent large mounted units for exploration to the north and west. One of these units disappeared inexplicably in summer 1241 near the city of Cölln at the bank of the river Spree. Ascanian chronicles speak of the direct intervention of the Saviour, a Chinese scribe reports a devilish fire on the armours of the riders, and flashes from their weapons, killing a majority of the men; the remaining ones fled in a panic. This incident is possibly one of the reasons for the seemingly causeless retreat of Batu Khan's victorious army, without which Europe would probably have become a Mongolian province.

At the end of the nineteenth century, an event happened at the Jordan chemical factory next to the area under discussion. Several wrought-iron kettles for the production of aniline in hall IV, located next to Schlesischer Busch, without discernable reason, heated up to incandescence. A great explosion happened, causing injuries to several workers. Since it was suspected that agents from the Russian secret police were behind this, the event even had an effect on the "three-emperor meeting" that took place in September of that year. A further documented incidence took place 95 years later. At the tower built by the border troops of the GDR in that area in the late 1970s, fire broke out, ammunition exploded, and numerous shots

were fired. In the west, it was assumed that a failed attempt to break through the border had occurred, and the GDR leadership did not usually comment on events like that. But as a witness, the then sergeant of the GDR border troops Dollmeier reports today, there had not been an attempt to escape at that time. For "inexplicable reasons", suddenly the barrels of some of the machine guns Kalashnikov AK 47, located in the weapon storage of the tower heated up extremely, the wooden gun rack caught fire, and two sergeants were slightly injured as a result of these events. Later, after the Ministry for State Security had investigated the case intensively, it classified it as a perfidious attack by the class enemy, to be countered with heightened watchfulness. Internally, a breach of order 30/74, i.e. alcohol abuse during service, was assumed.

The conclusion seems obvious that in all cases, historically so far apart, chaotic magnetic vortices were the cause of the incidents. This could possibly also explain the fact that beginning in 1961, in the border area Schlesischer Busch there was an increased frequency of firearm use that cannot be explained with the terrain alone. Possibly, border guards invented afterwards so-called border violations as a cover to explain inexplicable and not very believable stories of shots that went off by themselves.

It is also likely that the choice of the site for building a watchtower was not accidental. Today we know that the head of the pioneer division of the border regiment 33, colonel Sturm, who was responsible for the construction of the command tower, was a passionate adherent of various esoteric practices who chose the site for buildings personally with the aid of a dowsing rod to determine energy fields.

However, according to statements by witnesses, already in the 1920s the Thule-Gesellschaft and in the early 1940 the SS-Waffenhauptamt undertook experiments that suggest that the phenomenon was known at that time, and that apparently attempts were made to make it usable for the development of weapon technology. We only want to mention the magnetic ray gun "Odin 2", with the aid of which allied bomb attacks were supposed to be warded off, but which was never actually built.

The greatest mystery about the phenomenon is the question of the initialisation of the vortices, that is, when and how such a magnetic anomaly occurs. Earlier suspicions about the influence of the Coriolis effect, the intensity of sunspots, or other physical extraterrestrial factors apparently cannot be confirmed.

Bit is it obviously possible to cause outbreaks of smaller intensity with the aid of a so-called phase resonance applicator. According to reports, a similar instrument was also used in the 1920s. It consists of electromagnetic spools in a certain order that produce an alternating magnetic field, which at a certain frequency can lead to a resonant vortex. Strangely, instruments that were subjected to sanctification by the church yielded much better results. Enquiries about this to the Lutheran Church Berlin-Brandenburg unfortunately remained unanswered so far. Possibly, information about the phenomena described is still regarded as so explosive that every attempt is made to keep it secret to this day. (Translation: Wilhelm Werthern)
